It shows me the following message: Another extension related to mine is showing me: I'm probably doing something wrong in the installation of the first extension but I don't know what I'm missing. Could someone help me? If you need more information just ask, I'll provide it. Thank you in advance. A: This is caused by deleting firefox accidentally. I solved my problem by reinstalling the app. CALL FOR INITIATIVES: University of The Philippines Fernando University Provided by Association of Filipino University Graduates/Kapatiran ng Mga Aklatang The site and the domain name, University-of-Philippines-Fernando.com, has been transferred to the University of The Philippines. This change is currently being processed by Nitza.com, the registrar of the University of The Philippines' domain name system. For more information, please refer to the "Contact Information" in the site's site map. As the industry's power providers become increasingly frustrated with the increasing number of electrical devices on the grid, they're turning to the US government to find solutions. Specifically, power providers and the federal government have teamed up to create a new national grid. The goal is to have a resilient, digital and interconnected power grid by 2020 that can withstand natural disasters, cyberattacks and other problems. The first step is to create national standards for electric power systems. This means creating an industry code of conduct, creating a regulatory framework and providing a framework for utilities to learn from each other's successes and failures. The grid would also use wireless technology to help the power industry monitor, control and communicate with its systems remotely. The federal government is funding more than \$42 million of the project, which is the largest ever awarded to the Department of Energy. The Department of Energy recently issued a call for the codes to be delivered by January 31, 2018, and are seeking input to make the new standards inclusive and reflect the full scale of the electrical grid, which includes the transmission network and distribution system. According to the DOE, the updated codes will reflect the "state of the art" in power management and technology and will "provide a common foundation for utility, transmission and distribution companies" to build public-private partnerships that can "most efficiently deliver power."
